

CUDA C++ Exercise: Basic Linear Algebra Kernels: GEMM Optimization Strategies

Dmitry Lyakh

Scientific Computing

Oak Ridge Leadership Computing Facility

Oak Ridge National Laboratory

ORNL is managed by UT-Battelle, LLC for the US Department of Energy

Installing CUDA Basic Linear Algebra (BLA) Library

- Log in to BlueWaters @ NCSA:
 ssh <user_id>@bwbay.ncsa.illinois.edu
- Clone the BLA exercise repository (either way):
 git clone https://github.com/DmitryLyakh/CUDA_Tutorial.git
 or
 git clone /projects/training/bayr/CUDA_Tutorial
- If already cloned, cd CUDA_Tutorial and git pull
- Adjust Cray environment modules: module swap PrgEnv-cray PrgEnv-gnu module swap gcc/8.2.0 module load cudatoolkit
- Copy Makefile: /projects/training/bayr/CUDA_Tutorial/Makefile into your CUDA_Tutorial directory or make sure CUDA_HOST, CUDA_INC, CUDA_LIB match in the Makefile
- Run make: Builds binary bla_test.x
- Running bla_test.x on BlueWaters:
 - Open interactive session once (for one hour): qsub -I -l nodes=1:ppn=16:xk -l walltime=01:00:00
 - Adjust Cray modules again as described above (once per interactive session)
 - cd CUDA_Tutorial (enter your CUDA_Tutorial path)
 - aprun –n1 –N1 –d16 ./bla test.x

CUDA BLA Library Concepts: Matrix

- In file matrix.hpp: class Matrix<T>, T = {float, double}
- Matrix constructor: Matrix(nrows, ncols): No storage yet!
- Matrix storage: Matrix.allocateBody(int device):
 CPU Host: device = -1
 NVIDIA GPU: device = 0,1,2,... (only one GPU on BlueWaters)
 May simultaneously reside on Host and GPU: Needs sync (below)!
- Set to zero on given device: Matrix.zeroBody(int device)
- Set to some random value on Host: Matrix.setBodyHost()
- Synchronize value on multiple devices:
 Matrix.syncBody(int device, int source_device)

CUDA BLA Library Concepts: Matrix Operations

- Compute sum of the squares of all elements (on given device):
 double Matrix.computeNorm(int device)
- Add one matrix to another matrix (on given device):
 Matrix.add(Matrix & Amat, T alpha, int device)
- Multiply two matrices and add the result to another matrix:
 Matrix.multiplyAdd(bool left_transp, bool right_transp,
 Matrix & Amat, Matrix & Bmat, int device)
- Default Matrix.multiplyAdd GPU implementation expects:
 left_transp = false, right_transp = false
- Your exercise is to implement GPU kernels for all transposition cases: FalseTrue, TrueFalse, TrueTrue

CUDA BLA Library Implementation Benchmark

- Our test driver code: main.cpp: Function use_bla()
- Creates matrices A(m,k), B(k,n), C(m,n) with some m, n, k
- Computes the total flop count for matrix multiplication:
 Flop = 2*m*n*k, where factor of 2 is (multiply + add) = 2 Flop
- Executes matrix multiplication/accumulation (C.multiplyAdd):
 C(m,n) += A(m,k) * B(k,n)
- Function bla::reset_gemm_algorithm(int) chooses between:
 - 7: Highly optimized cuBLAS GEMM implementation
 - 2: Shared memory + registers based BLA GEMM (bla_lib.cu: gpu_gemm_sh_reg_nn)
 - 1: Shared memory based BLA GEMM (bla_lib.cu: gpu_gemm_sh_nn)
 - 0: Naïve BLA GEMM implementation (bla_lib.cu: gpu_gemm_nn)

CUDA BLA Library Implementation Benchmark

Testing your BLA GPU kernel implementation (main.cpp: use_bla() function):

```
for(int repeat = 0; repeat < 2; ++repeat){ //repeat experiment twice
C.zeroBody(0); //set matrix C body to zero on GPU#0
bla::reset_gemm_algorithm(0); //choose your algorithm: {0,1,2,7}
std::cout << "Performing matrix multiplication C+=A*B with BLA GEMM brute-force ... ";
double tms = bla::time_sys_sec(); //timer start
C.multiplyAdd(false,false,A,B,0); //default case {false,false}: You goal is {false,true}, {true,false}, {true,true}
double tmf = bla::time_sys_sec(); //timer stop
std::cout << "Done: Time = " << tmf-tms << " s: Gflop/s = " << flops/(tmf-tms)/1e9 << std::endl;
//Check correctness on GPU#0:
C.add(D,1.0f,0); //adding the correct result with a minus sign (matrix D) should give you zero matrix
auto norm_diff = C.computeNorm(0); //check its norm
std::cout << "Norm of the matrix C deviation from correct = " << norm diff << std::endl:
if(std::abs(norm_diff) > 1e-7){//report if norm is not zero enough
 std::cout << "#FATAL: Matrix C is incorrect, fix your GPU kernel implementation!" << std::endl;
 std::exit(1);
```

This benchmark is run for all available BLA GEMM algorithms: 0, 1, 2, 7 for the {false,false} case. Your goal is to implement and run other cases: {false,true}, {true,false}, {true,true}!

CUDA BLA Library: GEMM cases

- Matrix A(m,n) employs column-wise storage (standard BLAS):
 - A(0,0), A(1,0), A(2,0), ..., A(m-1,0), A(0,1), A(1,1), A(2,1), ..., A(m-1,n-1)
 - Linear offset of element (j,k) in storage is L(j,k) = (j + k*m)
 - **m** is the leading dimension extent in this case
- Matrix multiplication (false, false) case (implemented):
 - C(m,n) += A(m,k) * B(k,n)
- Matrix multiplication (false, true) case (your exercise):
 - C(m,n) += A(m,k) * B(n,k)
- Matrix multiplication (true,false) case (your exercise):
 - C(m,n) += A(k,m) * B(k,n)
- Matrix multiplication (true, true) case (your exercise):
 - C(m,n) += A(k,m) * B(n,k)

CUDA BLA Library: GEMM algorithms

- You will work inside **bla_lib.cu** source file directly with CUDA GEMM kernels
- Matrix multiplication {false,false} case (implemented):
 - C(m,n) += A(m,k) * B(k,n)
 - CUDA kernels: gpu_gemm_nn, gpu_gemm_sh_nn, gpu_gemm_sh_reg_nn
- Matrix multiplication {false,true} case (your exercise):
 - C(m,n) += A(m,k) * B(n,k)
 - CUDA kernels: gpu_gemm_nt, gpu_gemm_sh_nt, gpu_gemm_sh_reg_nt
- Matrix multiplication (true,false) case (your exercise):
 - C(m,n) += A(k,m) * B(k,n)
 - CUDA kernels: gpu_gemm_tn, gpu_gemm_sh_tn, gpu_gemm_sh_reg_tn
- Matrix multiplication (true, true) case (your exercise):
 - C(m,n) += A(k,m) * B(n,k)
 - CUDA kernels: gpu_gemm_tt, gpu_gemm_sh_tt, gpu_gemm_sh_reg_tt

```
template <typename T>
  global void gpu_gemm_nn(int m, int n, int k, T * restrict_dest, const T * restrict_left, const T * restrict_right)
                                                          Each CUDA thread block computes:
size t ty = blockldx.y*blockDim.y + threadIdx.y;
                                                          C(blockDim.x, blockDim.y) += A(blockDim.x, k) * B(k, blockDim.y)
size t tx = blockldx.x*blockDim.x + threadldx.x:
                                                                                             n
size t n pos = ty;
while(n_pos < n){
 size_t m_pos = tx;
                                                                     Thread
                                                                                   Thread
                                                                                                 Thread
                                                                                                               Thread
 while(m_pos < m){
                                                                     Block
                                                                                   Block
                                                                                                 Block
                                                                                                               Block
                                                                     (0,0)
                                                                                   (0,1)
                                                                                                 (0,2)
                                                                                                               (0,3)

    for(int_t j = 0; j < 4; ++j) rreg[j] = rbuf[threadldx.y + blockDim.y^*][l];
                                                                                                                                      elements loaded from
#pragma unroll
    for(int_t j = 0; j < 4; ++j) lreg[j] = lbuf[l][threadldx.x + blockDim.x*j];
                                                                                                                                      global memory
#pragma unroll
    for(int_t j = 0; j < 4; ++j){
                                                                                                                           CUDA SM Shared Memory
#pragma unroll
    for(int_t i = 0; i < 4; ++i){
     dreg[j][i] += lreg[i] * rreg[j];
                                                                                                                    CUDA SM Registers
   __syncthreads();
```

Each CUDA thread block computes: C(M = 4*blockDim.x, N = 4*blockDim.y) += A(M, k) * B(k, N)

Dimension k

CUDA BLA Library: Implement Your GEMM Algorithms

- You will work inside **bla_lib.cu** source file directly with CUDA GEMM kernels
- Matrix multiplication (false, false) case (already implemented):
 - C(m,n) += A(m,k) * B(k,n)
 - CUDA kernels: gpu_gemm_nn, gpu_gemm_sh_nn, gpu_gemm_sh_reg_nn
- Matrix multiplication (false, true) case (your exercise):
 - C(m,n) += A(m,k) * B(n,k)
 - CUDA kernels: gpu_gemm_nt, gpu_gemm_sh_nt, gpu_gemm_sh_reg_nt
- Matrix multiplication (true,false) case (your exercise):
 - C(m,n) += A(k,m) * B(k,n)
 - CUDA kernels: gpu_gemm_tn, gpu_gemm_sh_tn, gpu_gemm_sh_reg_tn
- Matrix multiplication (true, true) case (your exercise):
 - C(m,n) += A(k,m) * B(n,k)
 - CUDA kernels: gpu_gemm_tt, gpu_gemm_sh_tt, gpu_gemm_sh_reg_tt

CUDA BLA Library Implementation Benchmark

Testing your BLA GPU kernel implementation (main.cpp: use_bla() function):

```
for(int repeat = 0; repeat < 2; ++repeat){ //repeat experiment twice
C.zeroBody(0); //set matrix C body to zero on GPU#0
bla::reset_gemm_algorithm(0); //choose your algorithm: {0,1,2,7}
std::cout << "Performing matrix multiplication C+=A*B with BLA GEMM brute-force ... ";
double tms = bla::time sys sec(); //timer start
C.multiplyAdd(false,false,A,B,0); //default case {false,false}: You goal is {false,true}, {true,false}, {true,true}
double tmf = bla::time_sys_sec(); //timer stop
std::cout << "Done: Time = " << tmf-tms << " s: Gflop/s = " << flops/(tmf-tms)/1e9 << std::endl;
//Check correctness on GPU#0:
C.add(D,1.0f,0); //adding the correct result with a minus sign (matrix D) should give you zero matrix
auto norm diff = C.computeNorm(0); //check its norm
std::cout << "Norm of the matrix C deviation from correct = " << norm diff << std::endl;
if(std::abs(norm_diff) > 1e-7){//report if norm is not zero enough
 std::cout << "#FATAL: Matrix C is incorrect, fix your GPU kernel implementation!" << std::endl;
 std::exit(1);
```

This benchmark is run for all available BLA GEMM algorithms: 0, 1, 2, 7 for the {false,false} case. Your goal is to implement and run other cases: {false,true}, {true,false}, {true,true}! Use TEST_BLA_GEMM_BRUTE, TEST_BLA_GEMM_SHARED, TEST_BLA_GEMM_REGISTER switches in main.cpp:use_bla() to turn on/off specific GEMM algorithms (0,1,2, respectively).
